GRAVITY-wide: finding off-axis fringe tracking targets.

This newborn tool is in its first versions and is subject to various changes in its early development phase.

Underlying method:

You can query one or several Science Targets. For each of them, suitable ringe Tracker Targets will be given using following research methods:

- Main catalogs
  - **GSC2** The Guide Star Catalogue, Version 2.4.2 (2020)
  - **Simbad** CDS / Simbad
  - **Gaia DR3** Gaia DR3 catalogues and cross-matched catalogues though ESA archive center.
- Additionnal catalogs (use toggle button in the menu to get result tables)
  - **GDR2AP** The Astrophysical Parameters from Gaia DR2, 2MASS & AllWISE catalog through the GAVO DC.
  - **Gaia DR2** Gaia DR2 catalogues with its external catalogues cross-match though ESA archive center.

Each query is performed within 30'' of the Science Target. A magnitude filter is applied on every Fringe Tracker Targets according to the best limits offered in P110 for **UT (MACAO) OR AT (NAOMI)** respectively **(K < 11 AND V < 15) OR (K < 10 AND R<12.5)**. When missing, the V and R magnitudes are computed from the Gaia G, Grb and Grp magnitudes. The user must **refine its target selection** to take into account VLTI Adaptive Optics specifications before we offer a configuration selector in a future release.

- Enter comma separated names (SearchFTT will try to resolve it using Simbad) or coordinates (RA +/-DEC in degrees J2000), in the TextBox below.
- Move your pointer to the column titles of the result tables to get the column descriptions.
- To send a target to Aspro2 (already open), click on the icon in the GetStar column, then press "Send Votable".
- Please fill a report for any question or remark.

Science identifiers (comma separated)   🔍

Sky coverage for laser guide star adaptive optics supported off-axis fringe tracking with a fringe tracking star as faint as $m_K = 13$, and a maximum allowed separation of 30 arcsec.

powered by eXistdb - JMMC - SIMBAD - Archive - GAVO German Astrophysical Virtual Observatory - Aladin - VizieR

Une interface simple
...des recherches multi-datacenters/catalogues

- Contraintes instrumentales
  - pré-définies & paramétrables manuellement

- Génération dynamique de requêtes ADQL
  - 1 par target et par datacenter

- Regroupement des résultats

- Export vers Aspro2 en passant par GetStar

Pub : retrouvez toutes les versions des softs sur

https://releases.jmmc.fr

Disponible sur GitHub

- Depuis sa création en mars 2022 (3 jours de dev pour la V.1)
  - https://github.com/JMMC-OpenDev/searchftt

- Avec le reste de ses dépendances (jmmc-resources)
  - Depuis nov 2022 (12 dépôts existdb)

- Intégration continue (github actions)
  - Automatisation des releases depuis jan. 2023
  - Gain de temps pour les déploiements (infra docker/kubernetes)

Statistiques utilisateurs
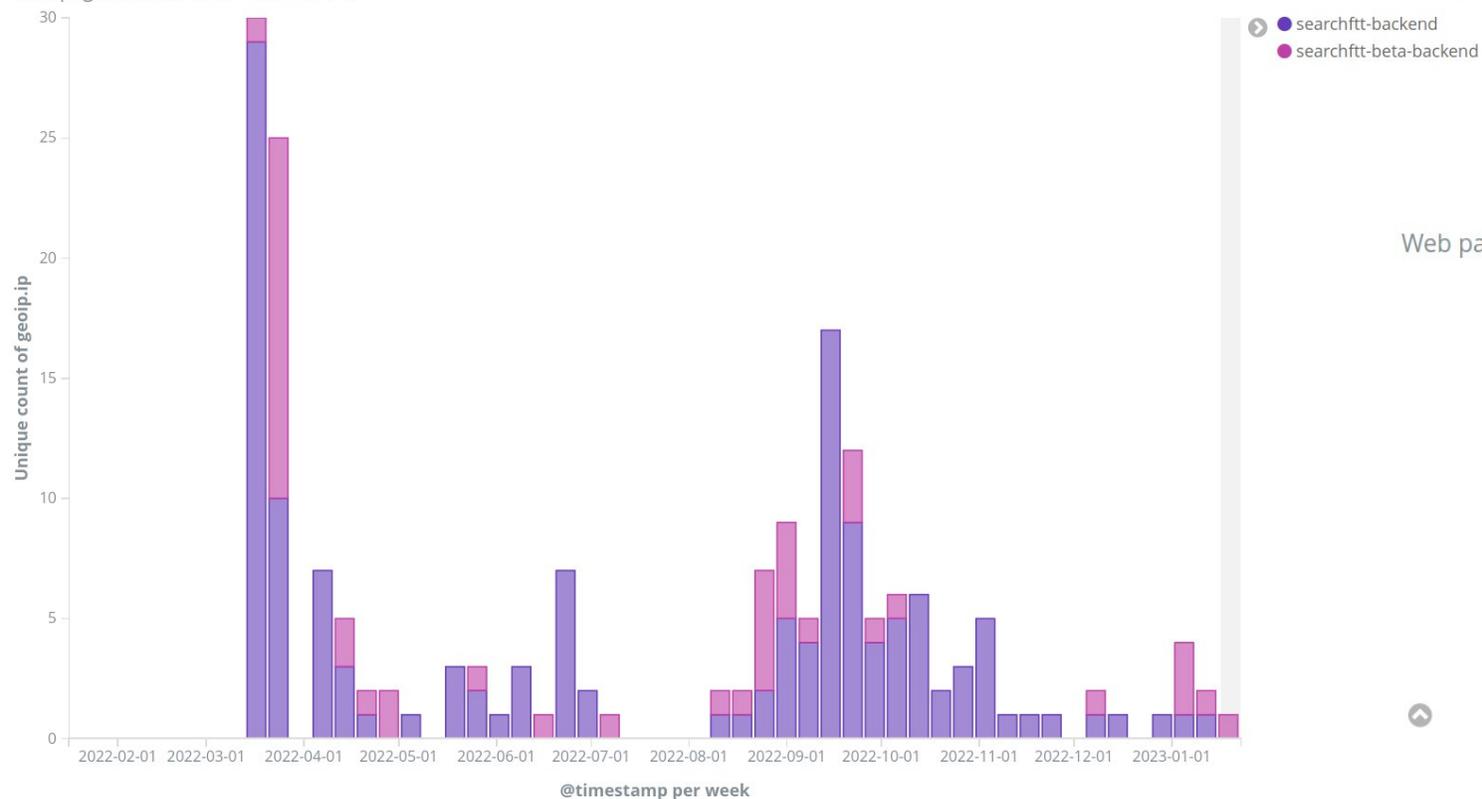

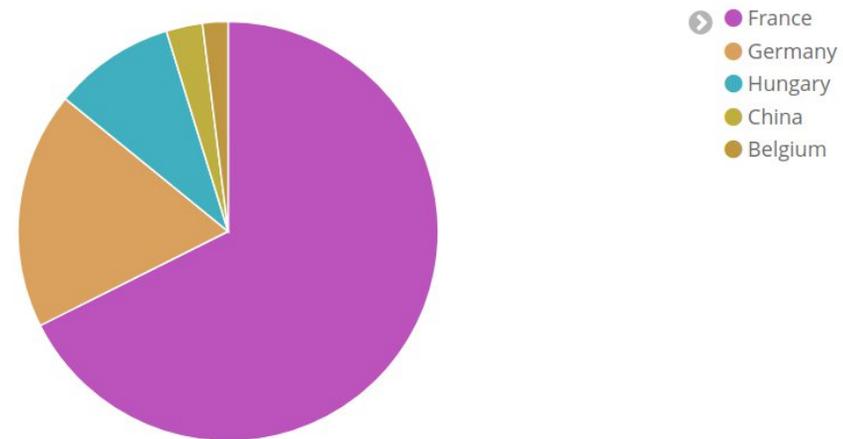

Quelle(s) publication(s) cite(nt) SearchFTT ?

• https://publications.olbin.org/toads?tag=SearchFTT

Possibles évolutions

- Réduction ou unification des catalogues d'entrée
- Interrogation par batch d'étoiles
  - Possible sur plusieurs centaines de cibles
- Extension des critères de recherche
  - AT/UT, SEEING, périodes CFP...
- Export des résultats votables, csv...
